<assert.h>

```
void assert(int expression);
    Macro used for internal error detection. (Ignored if NDEBUG is defined where <assert.h> is
    included.) If expression equals zero, message printed on stderr and abort called to terminate
    execution. Source filename and line number in message are from preprocessor macros __FILE__
    and __LINE__.
```

<ctype.h>

```
int isalnum(int c);
    isalpha(c) or isdigit(c)
int isalpha(int c);
    isupper(c) or islower(c)
int iscntrl(int c);
    is control character. In ASCII, control characters are 0x00 (NUL) to 0x1F (US), and 0x7F (DEL)
int isdigit(int c);
    is decimal digit
int isgraph(int c);
    is printing character other than space
int islower(int c);
```

```
is lower-case letter
int isprint(int c);
    is printing character (including space). In ASCII, printing characters are 0x20 (' ') to 0x7E ('~)
int ispunct(int c);
    is printing character other than space, letter, digit
int isspace(int c);
    is space, formfeed, newline, carriage return, tab, vertical tab
int isupper(int c);
    is upper-case letter
int isxdigit(int c);
    is hexadecimal digit
int tolower(int c);
    return lower-case equivalent
int toupper(int c);
    return upper-case equivalent
```

<errno.h>

errno
object to which **certain** library functions assign specific positive values on error
EDOM
code used for domain errors
ERANGE

code used for range errors

Notes:

- other implementation-defined error values are permitted
- to determine the value (if any) assigned to errno by a library function, a program should assign zero to errno immediately prior to the function call

<float.h>

```
FLT_RADIX
radix of floating-point representations
FLT_ROUNDS
floating-point rounding mode
```

Where the prefix "FLT" pertains to type float, "DBL" to type double, and "LDBL" to type long double:

```
FLT_DIG
DBL_DIG
LDBL_DIG
```

```
precision (in decimal digits)
FLT EPSILON
DBL EPSILON
LDBL_EPSILON
     smallest number x such that 1.0 + x != 1.0
FLT_MANT_DIG
DBL_MANT_DIG
LDBL_MANT_DIG
     number of digits, base FLT_RADIX, in mantissa
FLT MAX
DBL_MAX
LDBL_MAX
     maximum number
FLT_MAX_EXP
DBL_MAX_EXP
LDBL_MAX_EXP
     largest positive integer exponent to which FLT_RADIX can be raised and remain representable
FLT MIN
DBL_MIN
LDBL MIN
     minimum normalised number
FLT MIN EXP
DBL_MIN_EXP
LDBL_MIN_EXP
     smallest negative integer exponent to which FLT_RADIX can be raised and remain representable
```

limits.h>

```
CHAR BIT
    number of bits in a char
CHAR_MAX
     maximum value of type char
CHAR_MIN
    minimum value of type char
SCHAR_MAX
     maximum value of type signed char
SCHAR_MIN
     minimum value of type signed char
UCHAR_MAX
     maximum value of type unsigned char
SHRT MAX
     maximum value of type short
SHRT_MIN
     minimum value of type short
USHRT_MAX
     maximum value of type unsigned short
```

```
INT_MAX
    maximum value of type int

INT_MIN
    minimum value of type int

UINT_MAX
    maximum value of type unsigned int

LONG_MAX
    maximum value of type long

LONG_MIN
    minimum value of type long

ULONG_MAX
    maximum value of type long
```

<locale.h>

```
struct lconv
     Describes formatting of monetary and other numeric values:
     char* decimal_point;
           decimal point for non-monetary values
     char* grouping;
           sizes of digit groups for non-monetary values
     char* thousands sep;
           separator for digit groups for non-monetary values (left of "decimal point")
     char* currency_symbol;
           currency symbol
     char* int_curr_symbol;
           international currency symbol
     char* mon_decimal_point;
           decimal point for monetary values
     char* mon_grouping;
           sizes of digit groups for monetary values
     char* mon_thousands_sep;
           separator for digit groups for monetary values (left of "decimal point")
     char* negative sign;
           negative sign for monetary values
     char* positive_sign;
          positive sign for monetary values
     char frac_digits;
           number of digits to be displayed to right of "decimal point" for monetary values
     char int_frac_digits;
           number of digits to be displayed to right of "decimal point" for international monetary values
     char n_cs_precedes;
           whether currency symbol precedes (1) or follows (0) negative monetary values
     char n_sep_by_space;
           whether currency symbol is (1) or is not (0) separated by space from negative monetary
           values
```

```
char n_sign_posn;
           format for negative monetary values:
                parentheses surround quantity and currency symbol
           1
                sign precedes quantity and currency symbol
           2
                sign follows quantity and currency symbol
           3
                sign immediately precedes currency symbol
           4
                sign immediately follows currency symbol
     char p cs precedes;
           whether currency symbol precedes (1) or follows (0) positive monetary values
     char p_sep_by_space;
           whether currency symbol is (1) or is not (0) separated by space from non-negative monetary
           values
     char p sign posn;
           format for non-negative monetary values, with values as for n_sign_posn
     Implementations may change field order and include additional fields. Standard C Library
     functions use only decimal point.
struct lconv* localeconv(void);
     returns pointer to formatting information for current locale
char* setlocale(int category, const char* locale);
     Sets components of locale according to specified category and locale. Returns string describing
     new locale or null on error. (Implementations are permitted to define values of category
     additional to those describe here.)
LC ALL
     category argument for all categories
LC NUMERIC
     category for numeric formatting information
LC MONETARY
     category for monetary formatting information
LC COLLATE
     category for information affecting collating functions
LC CTYPE
     category for information affecting character class tests functions
LC_TIME
     category for information affecting time conversions functions
NULL
     null pointer constant
```

<math.h>

On domain error, implementation-defined value returned and errno set to EDOM. On range error, errno set to ERANGE and return value is HUGE_VAL with correct sign for overflow, or zero for underflow. Angles

are in radians.

```
HUGE VAL
     magnitude returned (with correct sign) on overflow error
double exp(double x);
     exponential of x
double log(double x);
     natural logarithm of x
double log10(double x);
     base-10 logarithm of x
double pow(double x, double y);
     x raised to power y
double sqrt(double x);
     square root of x
double ceil(double x);
     smallest integer not less than x
double floor(double x);
     largest integer not greater than x
double fabs(double x);
     absolute value of x
double ldexp(double x, int n);
     x times 2 to the power n
double frexp(double x, int* exp);
     if x non-zero, returns value, with absolute value in interval [1/2, 1), and assigns to *exp integer
     such that product of return value and 2 raised to the power *exp equals x; if x zero, both return
     value and *exp are zero
double modf(double x, double* ip);
     returns fractional part and assigns to *ip integral part of x, both with same sign as x
double fmod(double x, double y);
     if y non-zero, floating-point remainder of x/y, with same sign as x; if y zero, result is
     implementation-defined
double sin(double x);
     sine of x
double cos(double x);
     cosine of x
double tan(double x);
     tangent of x
double asin(double x);
     arc-sine of x
double acos(double x);
     arc-cosine of x
double atan(double x);
     arc-tangent of x
double atan2(double y, double x);
     arc-tangent of y/x
double sinh(double x);
     hyperbolic sine of x
double cosh(double x);
```

```
hyperbolic cosine of x double tanh(double x); hyperbolic tangent of x
```

<setjmp.h>

int raise(int sig);

jmp_buf

```
type of object holding context information
int setjmp(jmp_buf env);
   Saves context information in env and returns zero. Subsequent call to longjmp with same env
   returns non-zero.

void longjmp(jmp_buf env, int val);
   Restores context saved by most recent call to setjmp with specified env. Execution resumes as a
   second return from setjmp, with returned value val if specified value non-zero, or 1 otherwise.
```

```
SIGABRT
     abnormal termination
SIGFPE
     arithmetic error
SIGILL
     invalid execution
SIGINT
     (asynchronous) interactive attention
SIGSEGV
     illegal storage access
SIGTERM
     (asynchronous) termination request
SIG_DFL
     specifies default signal handling
SIG ERR
     signal return value indicating error
SIG_IGN
     specifies that signal should be ignored
void (*signal(int sig, void (*handler)(int)))(int);
     Install handler for subsequent signal sig. If handler is SIG_DFL, implementation-defined default
     behaviour will be used; if SIG_IGN, signal will be ignored; otherwise function pointed to by
     handler will be invoked with argument sig. In the last case, handling is restored to default
     behaviour before handler is called. If handler returns, execution resumes where signal occurred.
```

signal returns the previous handler or SIG_ERR on error. Initial state is implementation-defined.

Implementations may may define signals additional to those listed here.

Sends signal sig. Returns zero on success.

<stdarg.h>

va list

type of object holding context information

void va_start(va_list ap, lastarg);

Initialisation macro which must be called once before any unnamed argument is accessed. Stores context information in ap. lastarg is the last named parameter of the function.

type va_arg(va_list ap, type);

Yields value of the type (type) and value of the next unnamed argument.

void va_end(va_list ap);

Termination macro which must be called once after argument processing and before exit from function.

<stddef.h>

NULL

Null pointer constant.

offsetof(stype, m)

Offset (in bytes) of member *m* from start of structure type *stype*.

ptrdiff_t

Type for objects declared to store result of subtracting pointers.

size t

Type for objects declared to store result of sizeof operator.

<stdio.h>

BUFSIZ

Size of buffer used by setbuf.

EOF

Value used to indicate end-of-stream or to report an error.

FILENAME MAX

Maximum length required for array of characters to hold a filename.

FOPEN_MAX

Maximum number of files which may be open simultaneously.

L_tmpnam

Number of characters required for temporary filename generated by tmpnam.

NULI

Null pointer constant.

SEEK_CUR

```
Value for origin argument to fseek specifying current file position.
SEEK END
     Value for origin argument to fseek specifying end of file.
SEEK END
     Value for origin argument to fseek specifying beginning of file.
TMP MAX
     Minimum number of unique filenames generated by calls to tmpnam.
IOFBF
     Value for mode argument to setvbuf specifying full buffering.
     Value for mode argument to setvbuf specifying line buffering.
_IOFBF
     Value for mode argument to setvbuf specifying no buffering.
stdin
     File pointer for standard input stream. Automatically opened when program execution begins.
stdout
     File pointer for standard output stream. Automatically opened when program execution begins.
stderr
     File pointer for standard error stream. Automatically opened when program execution begins.
FILE
     Type of object holding information necessary to control a stream.
fpos_t
     Type for objects declared to store file position information.
size_t
     Type for objects declared to store result of sizeof operator.
FILE* fopen(const char* filename, const char* mode);
     Opens file named filename and returns a stream, or NULL on failure. mode may be one of the
     following for text files:
     "r"
           text reading
      " w "
           text writing
      "a"
           text append
      " ~ + "
           text update (reading and writing)
      "w+"
           text update, discarding previous content (if any)
      "a+"
           text append, reading, and writing at end
     or one of those strings with b included (after the first character), for binary files.
FILE* freopen(const char* filename, const char* mode, FILE* stream);
     Closes file associated with stream, then opens file filename with specified mode and associates it
     with stream. Returns stream or NULL on error.
int fflush(FILE* stream);
     Flushes stream stream and returns zero on success or EOF on error. Effect undefined for input
     stream. fflush(NULL) flushes all output streams.
int fclose(FILE* stream);
```

Closes stream stream (after flushing, if output stream). Returns EOF on error, zero otherwise. int remove(const char* filename); Removes specified file. Returns non-zero on failure. int rename(const char* oldname, const char* newname); Changes name of file oldname to newname. Returns non-zero on failure. FILE* tmpfile(); Creates temporary file (mode "wb+") which will be removed when closed or on normal program termination. Returns stream or NULL on failure. char* tmpname(char s[L_tmpnam]); Assigns to s (if s non-null) and returns unique name for a temporary file. Unique name is returned for each of the first TMP MAX invocations. int setvbuf(FILE* stream, char* buf, int mode, size_t size); Controls buffering for stream stream. mode is _IOFBF for full buffering, _IOLBF for line buffering, _IONBF for no buffering. Non-null buf specifies buffer of size size to be used; otherwise, a buffer is allocated. Returns non-zero on error. Call must be before any other operation on stream. void setbuf(FILE* stream, char* buf); Controls buffering for stream stream. For null buf, turns off buffering, otherwise equivalent to (void)setvbuf(stream, buf, _IOFBF, BUFSIZ). int fprintf(FILE* stream, const char* format, ...); Converts (according to format format) and writes output to stream stream. Number of characters written, or negative value on error, is returned. Conversion specifications consist of: O % O (optional) flag: left adjust always sign space space if no sign 0 zero pad Alternate form: for conversion character o, first digit will be zero, for [xx], prefix 0x or Ox to non-zero value, for [eEfgG], always decimal point, for [gG] trailing zeros not removed. O (optional) minimum width: if specified as *, value taken from next argument (which must be O (optional) . (separating width from precision): O (optional) precision: for conversion character s, maximum characters to be printed from the string, for [eff], digits after decimal point, for [gG], significant digits, for an integer, minimum number of digits to be printed. If specified as *, value taken from next argument (which must be int). O (optional) length modifier: h short or unsigned short 1 long or unsigned long

L

```
O conversion character:
           d.i
                int argument, printed in signed decimal notation
           0
                int argument, printed in unsigned octal notation
          x,X
                int argument, printed in unsigned hexadecimal notation
           u
                int argument, printed in unsigned decimal notation
           С
                int argument, printed as single character
           S
                char* argument
           f
                double argument, printed with format [-]mmm.ddd
           e,E
                double argument, printed with format [-]m \cdot dddddd(e|E)(+|-)xx
           g,G
                double argument
          р
                void* argument, printed as pointer
          n
                int* argument: the number of characters written to this point is written into argument
                no argument; prints %
int printf(const char* format, ...);
     printf(f, ...) is equivalent to fprintf(stdout, f, ...)
int sprintf(char* s, const char* format, ...);
     Like fprintf, but output written into string s, which must be large enough to hold the output,
     rather than to a stream. Output is NUL-terminated. Returns length (excluding the terminating NUL).
int vfprintf(FILE* stream, const char* format, va_list arg);
     Equivalent to fprintf with variable argument list replaced by arg, which must have been
     initialised by the va_start macro (and may have been used in calls to va_arg).
int vprintf(const char* format, va_list arg);
     Equivalent to printf with variable argument list replaced by arg, which must have been
     initialised by the va_start macro (and may have been used in calls to va_arg).
int vsprintf(char* s, const char* format, va_list arg);
     Equivalent to sprintf with variable argument list replaced by arg, which must have been
     initialised by the va_start macro (and may have been used in calls to va_arg).
int fscanf(FILE* stream, const char* format, ...);
     Performs formatted input conversion, reading from stream according to format format.
     The function returns when format is fully processed. Returns number of items converted and
     assigned, or EOF if end-of-file or error occurs before any conversion. Each of the arguments
     following format must be a pointer. Format string may contain:
        O blanks and tabs, which are ignored
        O ordinary characters, which are expected to match next non-white-space of input
        O conversion specifications, consisting of:
```

long double

```
■ (optional) assignment suppression character "*"
              ■ (optional) maximum field width
              ■ (optional) target width indicator:
                h
                      argument is pointer to short rather than int
                1
                      argument is pointer to long rather than int, or double rather than float
                L
                      argument is pointer to long double rather than float
              conversion character:
                      decimal integer; int* parameter required
                 i
                      integer; int* parameter required; decimal, octal or hex
                      octal integer; int* parameter required
                u
                      unsigned decimal integer; unsigned int* parameter required
                x
                      hexadecimal integer; int* parameter required
                С
                      characters; char* parameter required; white-space is not skipped, and
                      NUL-termination is not performed
                s
                      string of non-white-space; char* parameter required; string is NUL-terminated
                e,f,g
                      floating-point number; float* parameter required
                р
                      pointer value; void* parameter required
                n
                      chars read so far; int* parameter required
                 [...]
                      longest non-empty string from specified set; char* parameter required; string is
                      NUL-terminated
                 [^...]
                      longest non-empty string not from specified set; char* parameter required; string
                      is NUL-terminated
                      literal %; no assignment
int scanf(const char* format, ...);
     scanf(f, ...) is equivalent to fscanf(stdin, f, ...)
int sscanf(char* s, const char* format, ...);
     Like fscanf, but input read from string s.
int fgetc(FILE* stream);
     Returns next character from (input) stream stream, or EOF on end-of-file or error.
char* fgets(char* s, int n, FILE* stream);
     Copies characters from (input) stream stream to s, stopping when n-1 characters copied, newline
```

```
copied, end-of-file reached or error occurs. If no error, s is NUL-terminated. Returns NULL on
     end-of-file or error, s otherwise.
int fputc(int c, FILE* stream);
     Writes c, to stream stream. Returns c, or EOF on error.
char* fputs(const char* s, FILE* stream);
     Writes s, to (output) stream stream. Returns non-negative on success or EOF on error.
int getc(FILE* stream);
     Equivalent to fgetc except that it may be a macro.
int getchar(void);
     Equivalent to getc(stdin).
char* gets(char* s);
     Copies characters from stdin into s until newline encountered, end-of-file reached, or error
     occurs. Does not copy newline. NUL-terminates s. Returns s, or NULL on end-of-file or error.
     Should not be used because of the potential for buffer overflow.
int putc(int c, FILE* stream);
     Equivalent to fputc except that it may be a macro.
int putchar(int c);
     putchar(c) is equivalent to putc(c, stdout).
int puts(const char* s);
     Writes s (excluding terminating NUL) and a newline to stdout. Returns non-negative on success,
     EOF on error.
int ungetc(int c, FILE* stream);
     Pushes c (which must not be EOF), onto (input) stream stream such that it will be returned by the
     next read. Only one character of pushback is guaranteed (for each stream). Returns c, or EOF on
size_t fread(void* ptr, size_t size, size_t nobj, FILE* stream);
     Reads (at most) nobj objects of size size from stream stream into ptr and returns number of
     objects read. (feof and ferror can be used to check status.)
size_t fwrite(const void* ptr, size_t size, size_t nobj, FILE* stream);
     Writes to stream stream, nobj objects of size size from array ptr. Returns number of objects
     written.
int fseek(FILE* stream, long offset, int origin);
     Sets file position for stream stream and clears end-of-file indicator. For a binary stream, file
     position is set to offset bytes from the position indicated by origin: beginning of file for
     SEEK_SET, current position for SEEK_CUR, or end of file for SEEK_END. Behaviour is similar for a
     text stream, but offset must be zero or, for SEEK_SET only, a value returned by ftell. Returns
     non-zero on error.
long ftell(FILE* stream);
     Returns current file position for stream stream, or -1 on error.
void rewind(FILE* stream);
     Equivalent to fseek(stream, OL, SEEK_SET); clearerr(stream).
int fgetpos(FILE* stream, fpos_t* ptr);
     Stores current file position for stream stream in *ptr. Returns non-zero on error.
int fsetpos(FILE* stream, const fpos_t* ptr);
     Sets current position of stream stream to *ptr. Returns non-zero on error.
void clearerr(FILE* stream);
     Clears end-of-file and error indicators for stream stream.
int feof(FILE* stream);
```

```
Returns non-zero if end-of-file indicator is set for stream stream.
int ferror(FILE* stream);
     Returns non-zero if error indicator is set for stream stream.
void perror(const char* s);
     Prints s (if non-null) and strerror (errno) to standard error as would:
     fprintf(stderr, "%s: %s\n", (s != NULL ? s : ""), strerror(errno))
<stdlib.h>
EXIT_FAILURE
     Value for status argument to exit indicating failure.
EXIT SUCCESS
     Value for status argument to exit indicating success.
RAND_MAX
     Maximum value returned by rand().
NULL
     Null pointer constant.
div_t
     Return type of div(). Structure having members:
     int quot;
          quotient
     int rem;
          remainder
ldiv t
     Return type of ldiv(). Structure having members:
     long quot;
          quotient
     long rem;
          remainder
size_t
     Type for objects declared to store result of sizeof operator.
int abs(int n);
long labs(long n);
     Returns absolute value of n.
div t div(int num, int denom);
ldiv_t ldiv(long num, long denom);
     Returns quotient and remainder of num/denom.
double atof(const char* s);
     Equivalent to strtod(s, (char**)NULL) except that errno is not necessarily set on conversion
     error.
int atoi(const char* s);
     Equivalent to (int)strtol(s, (char**)NULL, 10) except that errno is not necessarily set on
     conversion error.
long atol(const char* s);
     Equivalent to strtol(s, (char**)NULL, 10) except that errno is not necessarily set on
```

conversion error.

```
double strtod(const char* s, char** endp);
```

Converts initial characters (ignoring leading white space) of s to type double. If endp non-null, stores pointer to unconverted suffix in *endp. On overflow, sets errno to ERANGE and returns HUGE_VAL with the appropriate sign; on underflow, sets errno to ERANGE and returns zero; otherwise returns converted value.

```
long strtol(const char* s, char** endp, int base);
```

Converts initial characters (ignoring leading white space) of s to type long. If endp non-null, stores pointer to unconverted suffix in *endp. If base between 2 and 36, that base used for conversion; if zero, leading (after any sign) 0x or 0x implies hexadecimal, leading 0 (after any sign) implies octal, otherwise decimal assumed. Leading 0x or 0x permitted for base hexadecimal. On overflow, sets errno to Erange and returns long_max or long_min (as appropriate for sign); otherwise returns converted value.

```
unsigned long strtoul(const char* s, char** endp, int base);
```

As for strtol except result is unsigned long and value on overflow is ULONG_MAX.

```
void* calloc(size_t nobj, size_t size);
```

Returns pointer to *zero-initialised* newly-allocated space for an array of *nobj* objects each of size *size*, or NULL on error.

```
void* malloc(size_t size);
```

Returns pointer to *uninitialised* newly-allocated space for an object of size *size*, or NULL on error. void* realloc(void* p, size_t size);

Returns pointer to newly-allocated space for an object of size size, initialised, to minimum of old and new sizes, to existing contents of p (if non-null), or NULL on error. On success, old object deallocated, otherwise unchanged.

```
void free(void* p);
```

If p non-null, deallocates space to which it points.

```
void abort();
```

Terminates program abnormally, by calling raise(SIGABRT).

```
void exit(int status);
```

Terminates program normally. Functions installed using atexit are called (in reverse order to that in which installed), open files are flushed, open streams are closed and control is returned to environment. status is returned to environment in implementation-dependent manner. Zero or EXIT_SUCCESS indicates successful termination and EXIT_FAILURE indicates unsuccessful termination. Implementations may define other values.

```
int atexit(void (*fcm)(void));
```

Registers fcn to be called when program terminates normally (or when main returns). Returns non-zero on failure.

```
int system(const char* s);
```

If s is not NULL, passes s to environment for execution, and returns status reported by command processor; if s is NULL, non-zero returned if environment has a command processor.

```
char* getenv(const char* name);
```

Returns string associated with name name from implementation's environment, or NULL if no such string exists.

```
void* bsearch(const void* key, const void* base, size_t n, size_t size, int
(*cmp)(const void* keyval, const void* datum));
```

Searches ordered array base (of n objects each of size size) for item matching key according to comparison function cmp. cmp must return negative value if first argument is less than second, zero if equal and positive if greater. Items of base are assumed to be in ascending order (according to

```
cmp). Returns a pointer to an item matching key, or NULL if none found.
void qsort(void* base, size_t n, size_t size, int (*cmp)(const void*, const void*));
     Arranges into ascending order array base (of n objects each of size size) according to comparison
     function cmp. cmp must return negative value if first argument is less than second, zero if equal and
     positive if greater.
int rand(void);
     Returns pseudo-random number in range 0 to RAND_MAX.
void srand(unsigned int seed);
     Uses seed as seed for new sequence of pseudo-random numbers. Initial seed is 1.
<string.h>
NULL
     Null pointer constant.
size t
     Type for objects declared to store result of sizeof operator.
char* strcpy(char* s, const char* ct);
     Copies ct to s including terminating NUL and returns s.
char* strncpy(char* s, const char* ct, size_t n);
     Copies at most n characters of ct to s. Pads with NUL characters if ct is of length less than n. Note
     that this may leave s without NUL-termination. Return s.
char* strcat(char* s, const char* ct);
     Concatenate ct to s and return s.
char* strncat(char* s, const char* ct, size t n);
     Concatenate at most n characters of ct to s. NUL-terminates s and return it.
int strcmp(const char* cs, const char* ct);
     Compares cs with ct, returning negative value if cs<ct, zero if cs==ct, positive value if cs>ct.
int strncmp(const char* cs, const char* ct, size t n);
     Compares at most (the first) n characters of cs and ct, returning negative value if cs<ct, zero if
     cs==ct, positive value if cs>ct.
int strcoll(const char* cs, const char* ct);
     Compares cs with ct according to locale, returning negative value if cs<ct, zero if cs==ct,
     positive value if cs>ct.
char* strchr(const char* cs, int c);
     Returns pointer to first occurrence of c in cs, or NULL if not found.
char* strrchr(const char* cs, int c);
     Returns pointer to last occurrence of c in cs, or NULL if not found.
size t strspn(const char* cs, const char* ct);
     Returns length of prefix of cs which consists of characters which are in ct.
size_t strcspn(const char* cs, const char* ct);
     Returns length of prefix of cs which consists of characters which are not in ct.
char* strpbrk(const char* cs, const char* ct);
     Returns pointer to first occurrence in cs of any character of ct, or NULL if none is found.
char* strstr(const char* cs, const char* ct);
     Returns pointer to first occurrence of ct within cs, or NULL if none is found.
size_t strlen(const char* cs);
```

```
char* strerror(int n);
     Returns pointer to implementation-defined message string corresponding with error n.
char* strtok(char* s, const char* ct);
     Searches s for next token delimited by any character from ct. Non-NULL s indicates the first call
     of a sequence. If a token is found, it is NUL-terminated and returned, otherwise NULL is returned. ct
     need not be identical for each call in a sequence.
size_t strxfrm(char* s, const char* ct, size_t n);
     Stores in s no more than n characters (including terminating NUL) of a string produced from ct
     according to a locale-specific transformation. Returns length of entire transformed string.
void* memcpy(void* s, const void* ct, size_t n);
     Copies n characters from ct to s and returns s. s may be corrupted if objects overlap.
void* memmove(void* s, const void* ct, size t n);
     Copies n characters from ct to s and returns s. s will not be corrupted if objects overlap.
int memcmp(const void* cs, const void* ct, size t n);
     Compares at most (the first) n characters of cs and ct, returning negative value if cs<ct, zero if
     cs==ct, positive value if cs>ct.
void* memchr(const void* cs, int c, size_t n);
     Returns pointer to first occurrence of c in first n characters of cs, or NULL if not found.
void* memset(void* s, int c, size_t n);
     Replaces each of the first n characters of s by c and returns s.
<time.h>
CLOCKS_PER_SEC
     The number of clock_t units per second.
NULL
     Null pointer constant.
clock t
     An arithmetic type elapsed processor representing time.
time t
     An arithmetic type representing calendar time.
struct tm
     Represents the components of calendar time:
     int tm sec;
          seconds after the minute
     int tm min;
           minutes after the hour
     int tm hour;
          hours since midnight
     int tm_mday;
           day of the month
     int tm mon;
           months since January
     int tm year;
```

Returns length of cs.

years since 1900

```
days since Sunday
     int tm yday;
           days since January 1
     int tm_isdst;
          Daylight Saving Time flag: is positive if DST is in effect, zero if not in effect, negative if
           information not known.
     Implementations may change field order and include additional fields.
clock_t clock(void);
     Returns elapsed processor time used by program or -1 if not available.
time_t time(time_t* tp);
     Returns current calendar time or -1 if not available. If tp is non-NULL, return value is also assigned
     to *tp.
double difftime(time_t time2, time_t time1);
     Returns the difference in seconds between time2 and time1.
time t mktime(struct tm* tp);
     If necessary, adjusts fields of *tp to fall withing normal ranges. Returns the corresponding
     calendar time, or -1 if it cannot be represented.
char* asctime(const struct tm* tp);
     Returns the given time as a string of the form:
     Sun Jan 3 13:08:42 1988\n\0
char* ctime(const time t* tp);
     Returns string equivalent to calendar time tp converted to local time. Equivalent to:
     asctime(localtime(tp))
struct tm* gmtime(const time_t* tp);
     Returns calendar time *tp converted to Coordinated Universal Time, or NULL if not available.
struct tm* localtime(const time_t* tp);
     Returns calendar time *tp converted into local time.
size_t strftime(char* s, size_t smax, const char* fmt, const struct tm* tp);
     Formats *tp into s according to fmt. Places no more than smax characters into s, and returns
     number of characters produced (excluding terminating NUL), or 0 if greater than smax. Formatting
     conversions (%c) are:
     Α
           name of weekday
     а
           abbreviated name of weekday
     В
           name of month
     b
           abbreviated name of month
     С
           local date and time representation
     d
           day of month [01-31]
     Η
          hour (24-hour clock) [00-23]
     Ι
          hour (12-hour clock) [01-12]
```

int tm_wday;

```
j
     day of year [001-366]
Μ
     minute [00-59]
m
     month [01-12]
р
     local equivalent of "AM" or "PM"
S
     second [00-61]
U
     week number of year (Sunday as 1st day of week) [00-53]
W
     week number of year (Monday as 1st day of week) [00-53]
     weekday (Sunday as 0) [0-6]
Χ
     local time representation
х
     local date representation
Y
     year with century
У
     year without century [00-99]
Z
     name (if any) of time zone
```

Local time may differ from calendar time because of time zone.

RLR
